

AutoGOLE (LHCONE) R&D activities

GLIF @ TNC18 Based On Presentation From LHCOPN – LHCONE meeting • RAL Abingdon (UK)

6-7 March 2018 • Gerben van Malenstein Presented By Joe Mambretti

Agenda

09:00 → 12:00 LHCONE: R&D activities

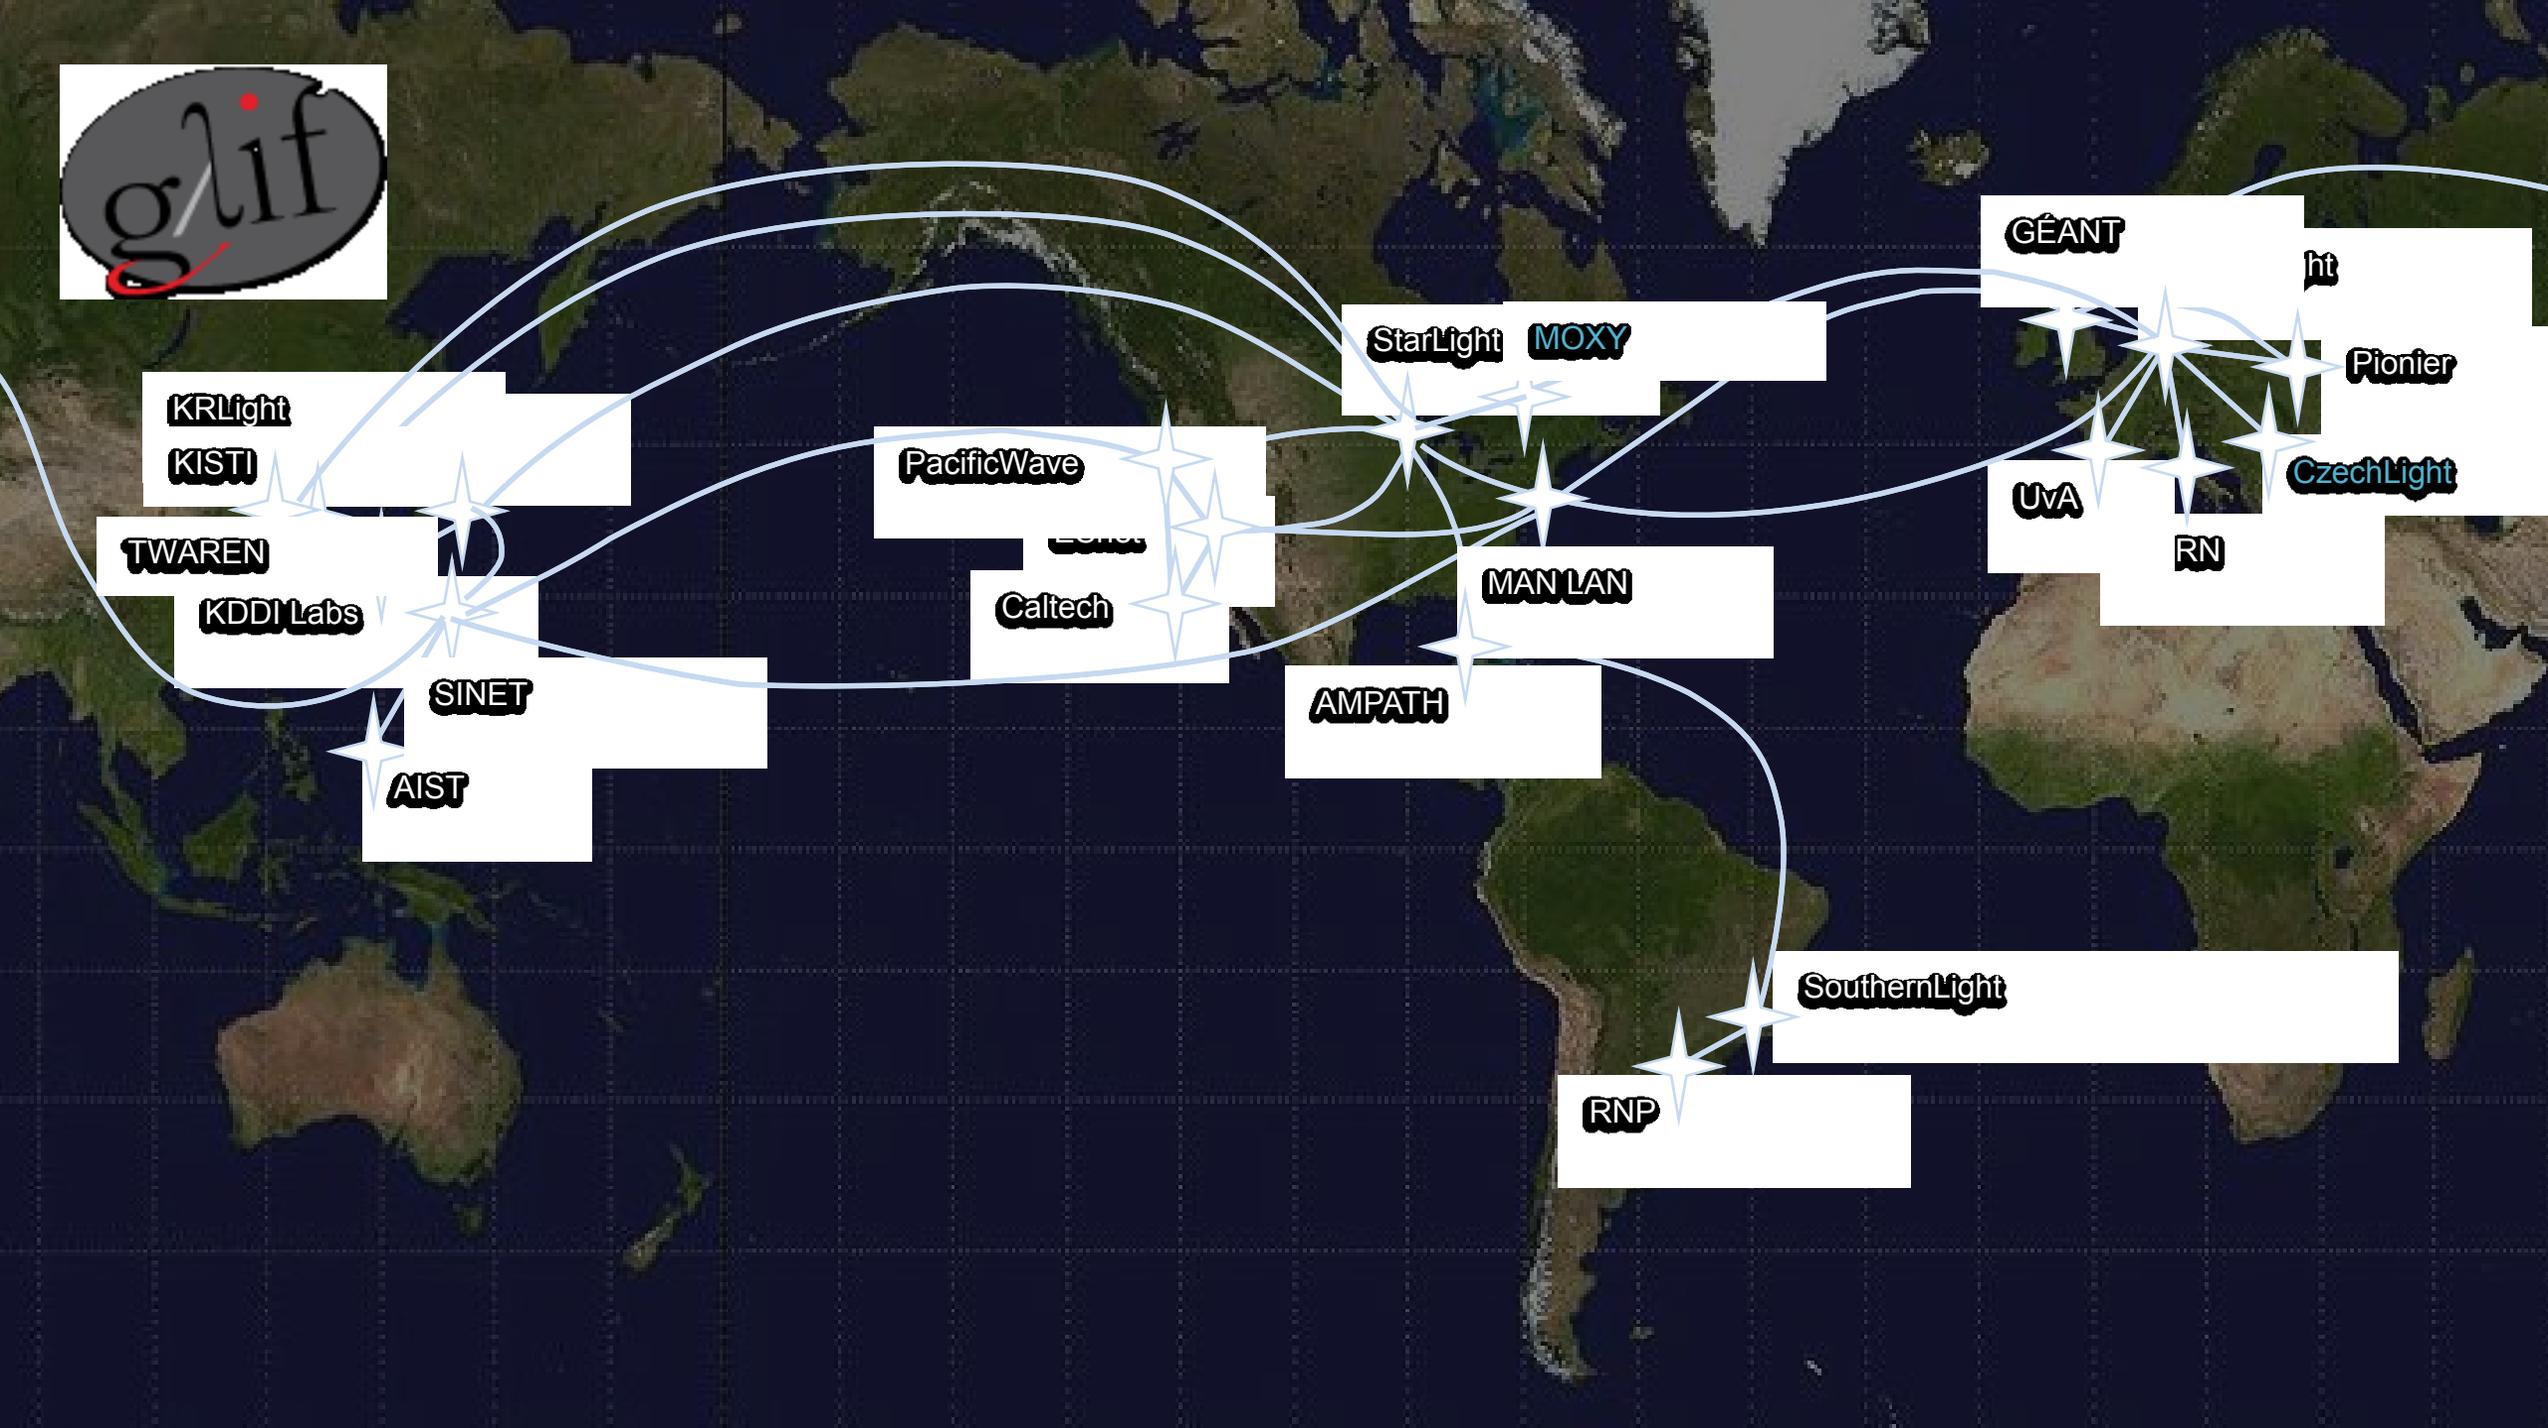

- 09:00 **Introduction** 10m
Speaker: Gerben van Malenstein (SURFnet)
- 09:10 **AutoGOLE update** 20m
Speaker: Gerben van Malenstein (SURFnet)
- 09:30 **Recent DTN demonstrations** 30m
Speaker: Joe Mambretti (International Center for Advanced Internet Research Northwestern University)
- 10:00 **Routing with BGP route servers - update** 10m
Speaker: Magnus Bergroth (NORDUnet)
- 10:15 **Global research platform update** 15m
Speaker: Joe Mambretti (International Center for Advanced Internet Research Northwestern University)
- 10:30 **Coffee break** 30m
- 11:00 **NORDUnet activities** 10m
Speaker: Lars Fischer (NORDUnet)
- 11:10 **Discussion: Next steps towards production service** 50m
Speaker: Gerben van Malenstein (SURFnet)

12:00 → 13:00 LHCONE: plans

- 12:00 **Next actions** 15m
- 12:15 **Wrap-up and next meeting** 15m

AutoGOLE update: overview

- **AutoGOLE fabric delivers dynamic layer 2 network services between Open Exchanges and networks, designed as a multi-domain system**
 - Based on Network Service Interface (NSI) Connection Service
 - Hub and spoke architecture
 - 29 Network Service Agents (6 aggregators, 23 uPA) advertising 30 networks worldwide
 - Using DDS service for NSA discovery and document propagation between aggregators
 - Advanced capabilities
 - Experimenting with new path finding and signaling algorithms
 - Additional network modeling for optimizations
 - Reducing old-school multi-domain human provisioning lead times
 - Introduction of multi-domain possibilities for monitoring, troubleshooting and provisioning
 - AutoGOLE Dashboard (former prototype)
 - MEICAN Pilot

OnDemand services, multi-domain

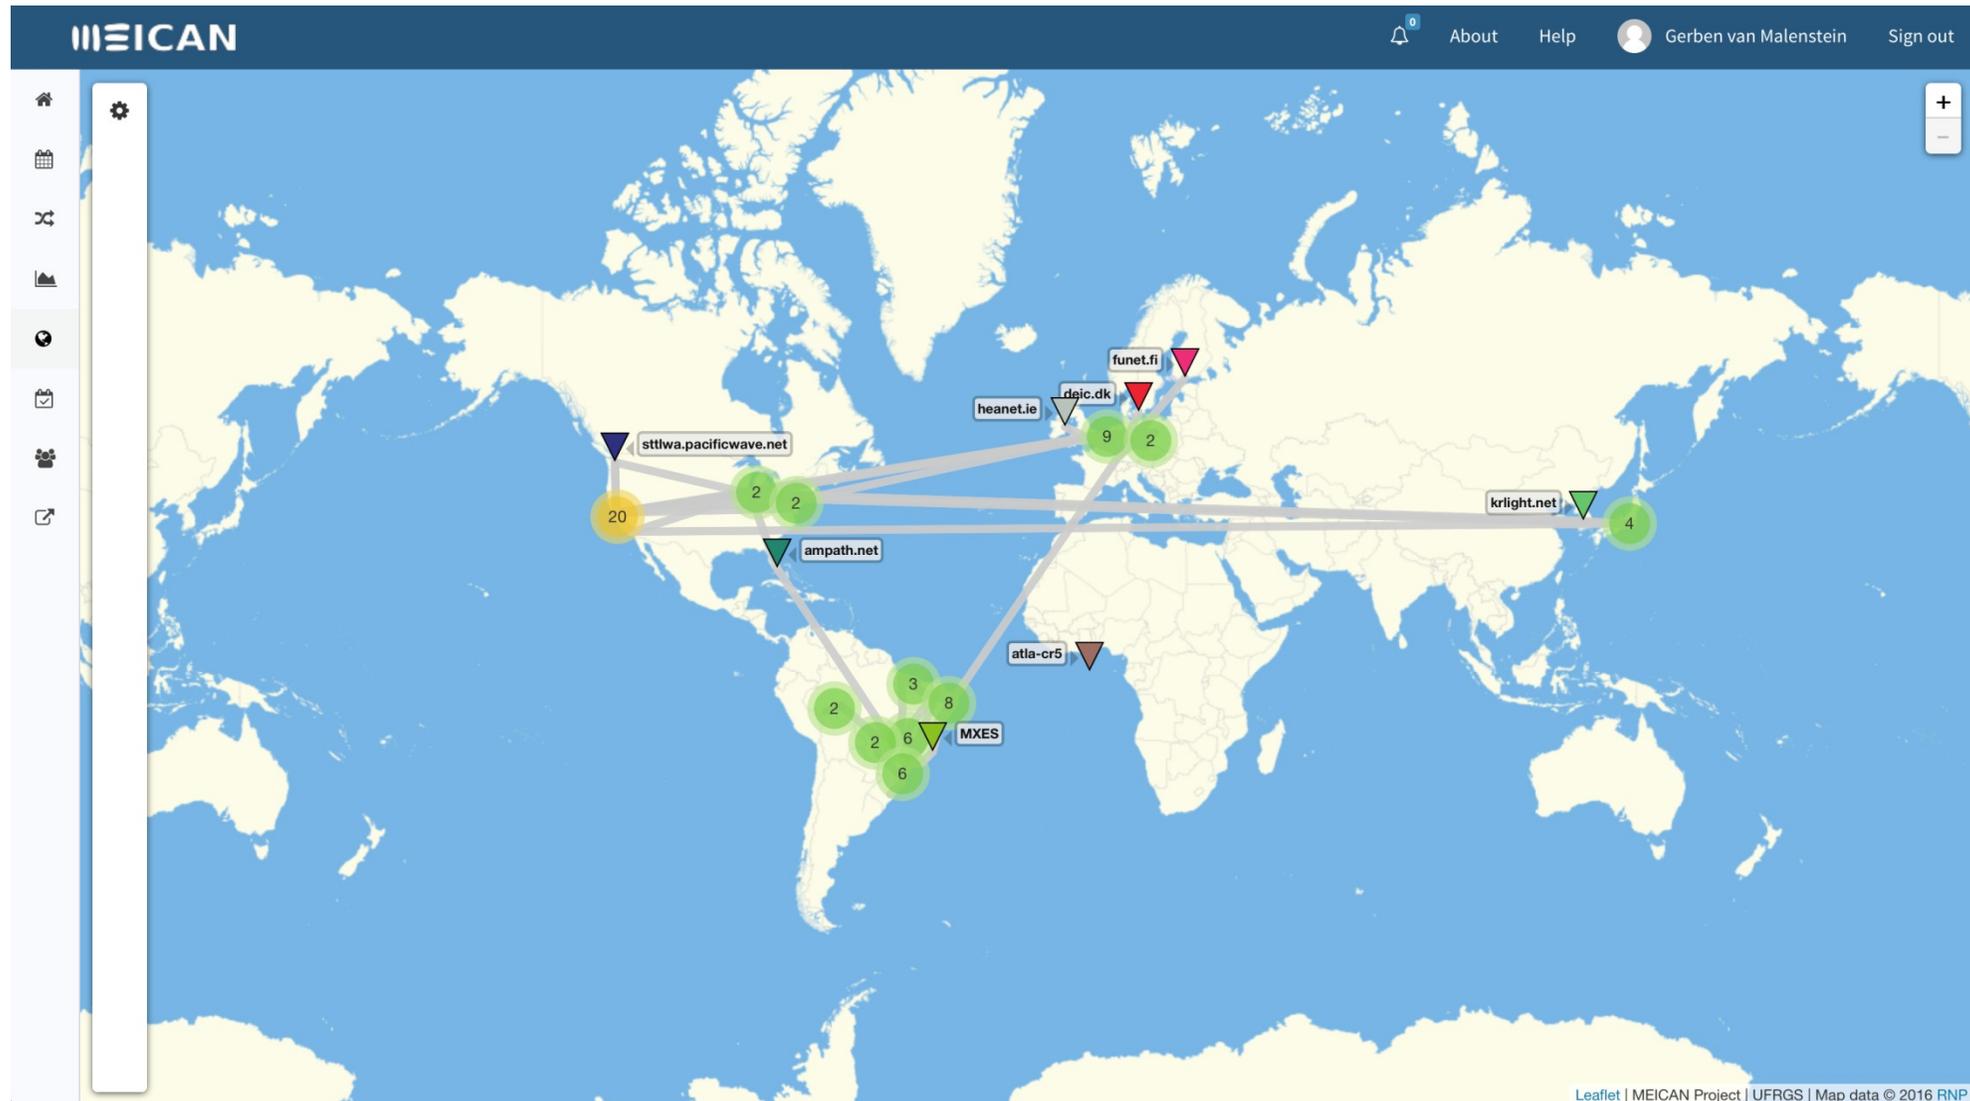

Why MEICAN for the AutoGOLE?

- **Looking for 1 provisioning tool for NOCs and users, a front-end for the AutoGOLE**
- Comparison of multi-domain provisioning systems after GLIF AutoGOLE meeting in May 2016
- MEICAN
 - Interface offers support for creation, modification and deletion of multi-domain services
 - Interface is intuitive, easy access to world-wide (true multi-domain) provisioning of service
 - Offers features such as user roles, authorization and workflows
 - Monitoring of services becomes possible
 - Debugging for NOCs possible
 - Supporting the Network Service Interface

MEICAN: moving towards a production-grade multi-domain network service provisioning tool

MEICAN Topology

MEICAN Circuit reservation – path info

The screenshot displays the MEICAN web interface for Circuit #182. The top navigation bar includes the MEICAN logo, a menu icon, and user information for John Hess. The left sidebar lists various system components. The main content area shows the circuit's status as Active, reservation as Provisioned, authorization as Approved, and the last update on 02/21/2017 at 14:45. A path table lists 8 hops with their respective URNs and VLANs. A details panel on the right provides specific circuit information such as ID, name, bandwidth, and start/end dates. At the bottom, there are sections for traffic monitoring and history.

History

MEICAN experiences and results so far

- RNP provides active participation and support to the AutoGOLE project
- International circuits for research activities have been created
- NOC engineers involved

- <https://wiki.rnp.br/display/secipo/AutoGOLE+MEICAN+Pilot>

Timeline 2016-2017 MEICAN pilot

Phase 1

Form a coalition of AutoGOLE partners that want to join. These are: PacificWave, SINET, StarLight, RNP, NetherLight/SURFnet.

AutoGOLE is open to others joining this effort.

Phase 2

Create and test an implementation with MEICAN.

Engage NOC engineers and put them into the Playground first, then production system, get their feedback.

Phase 3

Phase 3

Try-outs of MEICAN by production NOCs.

Phase 4

Phase 4

Facilitate collaborations and research projects.

Show the difference between regular IP connectivity and on-demand circuits.

AutoGOLE workplan 2018

1. More peerings & expansion (data plane, world-wide coverage)

- Adding 100G DTN hardware, integrating DTNs in the WAN
- Onboarding CESNET, GTS, MOXY

2. Recurring process to check link state

- MEICAN can also setup connections automatically

3. Growing MEICAN setup (control plane)

- Collaboration with the GNA TF provisioning subgroup (next slide)
- Assigning a responsible operations engineer per site

Global Exchange Point Working Group Charter

- The core goals of this group is to make Global Exchange Points more useable by defining how to build on GNA 1.0. In particular the group will aim to achieve a very useable Global Exchange Point that includes provisioning interfaces, measurement interfaces, and reporting that will help make interactions with the open exchange user-friendly.

global network architecture

GNA: Automating Global Exchange Point provisioning

“This work items recognises that Global Exchange Points are not operated by a single network provider, but are operated by separate network providers. This means that commercially available control planes for service provisioning are not suitable for provider-to-provider service instantiation. This task will investigate recent work to solve this problem and propose a solution that best suits the needs of the GNA community.”
